this book brings together the personal accounts and reflections of nineteen mathematical model builders whose specialty is probabilistic modelling the reader may well wonder why apart from personal interest one should commission and edit such a collection of articles there are of course many reasons but perhaps the three most relevant are i a philosophical interest in conceptual models this is an interest shared by everyone who has ever puzzled over the relationship between thought and reality ii a conviction not unsupported by empirical evidence that probabilistic modelling has an important contribution to make to scientific research and finally iii a curiosity historical in its nature about the complex interplay between personal events and the development of a field of mathematical research namely applied probability let me discuss each of these in turn philosophical abstraction the formation of concepts and the construction of conceptual models present us with complex philosophical problems which date back to democritus plato and aristotle we have all at one time or another wondered just how we think are our thoughts concepts and models of reality approximations to the truth or are they simply functional constructs helping us to master our environment nowhere are these problems more apparent than in mathematical modelling where idealized concepts and constructions replace the imperfect realities for which they stand
